

Elbow

(revised 12/2009)

Axial imaging, start below the Radial Tuberosity to above the Olecranon fossa

Coronal imaging, start below the triceps tendon insertion (Olecranon) to the biceps tendon.

Sagittal imaging, adjust slices perpendicular to the humeral epicondyles. Scan through epicondyles

Use extremity coil with patient in "superman position", otherwise position patient supine with patient positioned so the elbow is as close to isocenter as possible.

Place arm straight in a supinated position.

- 1. AXIAL PD Hybrid fs**
- 2. AXIAL PD**
- 3. CORONAL PD Hybrid FS**
- 4. CORONAL T1**
- 5. CORONAL MPGR**
- 6. SAGITTAL T2 TSE FS**

Optional

SAGITTAL STIR only if poor fs
